

Type-Aware Decomposition as Mechanism-Aligned Routing

Section 3.4 links mechanism cues, six variable types, and routing roles in the current implementation.

1. Type Assignment

$$\tau(i) = \text{TypeAssign}(m_i, s_i, d_i)$$

metadata, temporal signature, dependency pattern

m_i

Metadata / engineering role
engineering role and semantics

s_i

Temporal signature
step, dwell, inertia, sparsity

d_i

Dependency pattern
driver, feedback, derivation

Routing labels

T1

T2

T3

T4

T5

T6

2. Six-Type Taxonomy

Canonical signatures associated with the six types.

T1

Program / setpoint

externally commanded

T2

Controller output

feedback-driven control

T3

Actuator state

actuation regime

T4

Process variable

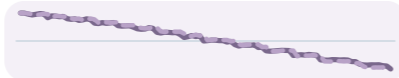

physical process response

T5

Derived / deterministic

deterministic companion

T6

Auxiliary signal

auxiliary context

3. Routing in Current Code

Type 1 + file_id
conditioning

Types 2 / 3 / 4 / 6
learned branch

Shared hybrid generator
trend modeling + mixed diffusion

Type 5 deterministic reconstruction
rule-based recovery

Typed assembly
conditioned + learned + deterministic outputs

Current implementation: T1 conditioning, T5 deterministic, others shared.
